The entire population of Equatorial Guinea is at high risk of malaria and the transmission is intense all year round. The annual reported number of malaria cases in 2018 was 6,099.
Malaria
Sustaining Essential Health Services During the COVID-19 Pandemic
The COVID-19 pandemic is putting an incredible strain on health systems across Africa. Health systems are required to maintain routine health services for other illnesses even as they handle the additional burden. In order to prevent widespread morbidity and mortality, it is of vital importance that we work to sustain the delivery of essential life-saving interventions during this difficult time including for Reproductive, Maternal, Newborn, Adolescent and Child health and malaria. WHO underlines the critical importance of sustaining efforts to prevent, detect and treat malaria during the COVID-19 pandemic. It is of vital importance to ensure the continuity of malaria prevention and treatment services including distribution of insecticide-treated nets and indoor residual spraying, as well as chemoprevention for pregnant women (intermittent preventive treatment in pregnancy). Any intervention must consider the importance of both lowering malaria-related mortality and ensuring the safety of communities and health workers given the ease of transmission of COVID-19.

For Equatorial Guinea, the country is encouraged to sustain the delivery of essential health services including malaria case management, during the COVID-19 pandemic. Without this, it is estimated by WHO that there will be an increase in malaria cases and deaths. Under the worst-case scenario, in which there is a 75% reduction in access to effective antimalarial medicines, WHO estimate that there could be a 3.8% increase in malaria cases, and a 30.8% increase in malaria deaths in Equatorial Guinea. This scenario would represent a complete reversal in the substantial progress in malaria mortality reductions seen over the last 2 decades.

Progress
Equatorial Guinea has made progress with malaria control on Bioko Island and is working to extend this success to the mainland. The country has completed the national insecticide resistance monitoring and management plan and has reported the results of insecticide resistance monitoring to WHO.

Impact
The annual reported number of malaria cases in 2018 was 6,099.

Key Challenge
- Sustaining the delivery of essential life-saving interventions during the COVID-19 pandemic including for Reproductive, Maternal, Newborn, Adolescent and Child health including malaria.

Equatorial Guinea has responded positively to the previous recommended actions addressing low coverage of iCCM and continues to track progress as this action is implemented.

**RMNCAH and NTDs**

**Progress**

Progress in addressing Neglected Tropical Diseases (NTDs) in Equatorial Guinea is measured using a composite index calculated from preventive chemotherapy coverage achieved for lymphatic filariasis, onchocerciasis, schistosomiasis and soil transmitted helminths. The country has not reported preventive chemotherapy coverage in 2018 to WHO.

</table>

Equatorial Guinea has responded positively to the RMNCAH recommended actions addressing lack of data on vitamin A and low coverage of exclusive breastfeeding, ARTs and DPT3. The country continues to track progress as these actions are implemented, and the country has recently increased ART coverage in children.
