Malaria transmission is seasonal in Eswatini; the annual reported number of malaria cases in 2019 was 722 and 3 deaths.
Malaria
Sustaining Essential Health Services During the COVID-19 Pandemic
The COVID-19 pandemic is putting an incredible strain on health systems across Africa. Health systems are required to maintain routine health services for other illnesses even as they handle the additional burden of COVID-19. In order to prevent widespread morbidity and mortality, it is of vital importance that we work to sustain the delivery of essential life-saving interventions during this difficult time including for Reproductive, Maternal, Newborn, Adolescent and Child health, Neglected Tropical Diseases and malaria.

WHO underlines the critical importance of sustaining efforts to prevent, detect and treat malaria during the COVID-19 pandemic. It is of vital importance to ensure the continuity of malaria prevention and treatment services including distribution of insecticide-treated nets and indoor residual spraying.

It is essential to ensure the continuity of malaria, RMNCAH and NTD services in 2021 as the COVID-19 pandemic continues to impact our continent. This may include the implementation of any necessary catch-up activities and ensuring timely planning to account for potential delays in procurement and delivery. Any intervention must ensure the safety of communities and health workers given the ease of transmission of COVID-19.

Progress
Eswatini secured sufficient resources to fund the IRS, ACTs, and RDTs required to sustain universal coverage in 2021. WHO has identified Eswatini as being a country with the potential to eliminate local transmission of malaria. The country has finalised the insecticide resistance monitoring and management plan. Eswatini increased the coverage of IRS in 2021. The country has sufficient stocks of ACTs and insecticide required for the IRS. Eswatini is a member of the Elimination 8 and MOSASWA initiatives, strengthening their cross-border collaboration with neighbouring countries. The country also launched its Zero Malaria Starts with Me campaign.

In line with the legacy agenda of the ALMA chair, His Excellency President Uhuru Kenyatta, building of the agenda of His Majesty King Mswati III, in May 2019, the country launched an End Malaria Fund to raise US$5 million towards malaria elimination. Eswatini was the first country in Africa to introduce a malaria elimination scorecard to enhance tracking, accountability and action as the country moves towards malaria elimination and this has been publicly posted to the ALMA Scorecard knowledge hub.

Impact
The annual reported number of malaria cases in 2019 was 722 with 3 deaths.

Key Challenges
- Maintaining malaria high on the political and funding agenda.
- Sustaining the delivery of essential life-saving interventions during the COVID-19 pandemic including for Reproductive, Maternal, Newborn, Adolescent and Child health, malaria and NTDs.
<table>
<thead>
<tr>
<th>Objective</th>
<th>Action Item</th>

<tbody>
<tr>
<td>Impact</td>
<td>Ensure that malaria services including case management and vector control are sustained and implemented whilst using COVID-19 sensitive guidelines during the pandemic</td>
<td>Q4 2020</td>
<td></td>
<td>In relation to Case Management, the programme encouraged early health care treatment seeking behaviour for fever and suspected malaria by the general population through billboards and radio adverts. This communication encouraged the population suffering from fever to test for malaria. The programme further ensured access to case management services in health facilities and communities through maintaining the availability Rapid Diagnostic Tests (RDTs) for those suspected of having malaria. These commodities were delivered to facilities promptly to avoid stock out. The country has been faced with procurement bottlenecks for essential malaria commodities. The insecticide for the forthcoming spray season has been ordered and is expected in August whilst the hiring of spray operators is underway.</td>
</tr>
<tr>
<td>Impact</td>
<td>Investigate and address the reasons for the increase in estimated malaria incidence between 2015 and 2019, which means that the country is not on track to achieve the 2020 target of a 40% reduction in malaria incidence</td>
<td>Q4 2021</td>
<td></td>
<td>At the development of the MSP in 2015, the country had 68 locally transmitted cases reported. Based on that figure, yearly targets were set with the goal of eliminating by 2020. The unfortunate turn of events in 2017 saw the country witnessing an upsurge of cases. The increase in cases was as a result of delays in implementation of vector control interventions such as IRS due to procurement challenges. Alert thresholds were seen early in the season (2017/2018) that the country was heading for an epidemic situation and due to the lack of insecticides the programme could not respond timely and to contain the situation. In 2020 the NMP developed a 3 year strategy to eliminate malaria by 2023 and the outcomes of the Mid Term Review highlighted the need to ensure early forecasting and procurement of Insecticides as well as anti-malarials. The NMP submits these forecasts timely for Government procurement and is working with the relevant departments to ensure delays are averted in the course of elimination and sustained elimination gains post 2023.</td>

Eswatini has responded positively to the recommended actions addressing reporting insecticide resistance data to WHO and the lack of data on iCCM and continues to strengthen access to treatment of malaria, pneumonia and diarrhoea.

**New Key Recommended Action**

<tbody>
<tr>
<td>Vector Control</td>
<td>Ensure the IRS commodities are procured in time for the 2021 IRS campaigns</td>
<td>Q3 2021</td>
</tr>
</tbody>
</table>

**RMNCAH and NTDs**

**Progress**

Good progress has been made on tracer RMNCAH interventions including DPT3, skilled birth attendants, exclusive breast feeding, postnatal care and coverage of ARTs in the total population. Eswatini has significantly enhanced tracking and accountability mechanisms with the development of a Reproductive, Maternal, Newborn Child and Adolescent Health Scorecard.

Progress in addressing Neglected Tropical Diseases (NTDs) in Eswatini is measured using a composite index calculated from preventive chemotherapy coverage achieved for schistosomiasis and soil transmitted helminths. Preventive chemotherapy coverage in Eswatini is good for soil-transmitted helminths (79%). Data for schistosomiasis are still under validation.
