The entire population of Sierra Leone is at high risk of malaria. The annual reported number of malaria cases in 2020 was 1,223,397 with 1,648 deaths.
Sustaining Essential Health Services During the COVID-19 Pandemic

The COVID-19 pandemic is putting an incredible strain on health systems across Africa. Health systems are required to maintain routine health services for other illnesses even as they handle the additional burden. In order to prevent widespread morbidity and mortality, it is of vital importance that we work to sustain the delivery of essential life-saving interventions during this difficult time including for Reproductive, Maternal, Newborn, Adolescent and Child health, Neglected Tropical Diseases and malaria.

Under the worst-case scenario, in which all ITN campaigns are suspended and there is a 75% reduction in access to effective antimalarial medicines, WHO estimate that there could be a 29.3% increase in malaria cases, and a 99.6% increase in malaria deaths in Sierra Leone. This scenario would represent a complete reversal in the substantial progress in malaria mortality reductions seen over the last 2 decades.

WHO estimates that there were an additional 47,000 malaria deaths globally in 2020 due to service disruptions during the COVID-19 pandemic, leading to an estimated 7.5% increase in deaths.

It is essential to ensure the continuity of malaria, RMNCAH and NTD services in 2022 as the COVID-19 pandemic continues to impact our continent. This may include the implementation of any necessary catch-up activities and ensuring timely planning to account for potential delays in procurement and delivery. Any intervention must ensure the safety of communities and health workers given the ease of transmission of COVID-19.

The country has been affected by the continent-wide restriction of access to COVID-19 vaccines and had only been able to cover 5% of their population by the end of 2021.

Malaria

Progress
Sierra Leone secured sufficient resources to achieve universal coverage of LLINs, RDTs and ACTs in 2021 and has distributed sufficient LLINs to achieve 100% operational coverage of the targeted at risk population. The country has carried out insecticide resistance monitoring since 2015 and has reported the results to WHO and has recently finalised the insecticide resistance monitoring and management plan. Sierra Leone has launched the Zero Malaria Starts with Me campaign.

In line with the legacy agenda of the ALMA chair, His Excellency President Uhuru Kenyatta, Sierra Leone has significantly enhanced the tracking and accountability mechanisms for malaria with the development of a Malaria Control and Elimination Scorecard, although the scorecard has not yet been posted to the ALMA Scorecard Hub.

Impact
The annual reported number of malaria cases in 2020 was 1,223,397 with 1,648 deaths.

Key Challenge
- Sustaining the delivery of essential life-saving interventions during the COVID-19 pandemic including for Reproductive, Maternal, Newborn, Adolescent and Child health, malaria and Neglected Tropical Diseases.
Impact | Ensure that malaria services including case management and vector control are sustained and implemented whilst using COVID-19 sensitive guidelines during the pandemic | Q4 2022 | Sierra Leone has worked to sustain case management during the COVID-19 pandemic but the pandemic has impacted accessibility and utilization of malaria services. This is evidenced by a drop in key coverage indicators. The disruptive effects of COVID-19 pandemic on malaria services have included decreased health facility attendance due to fear of contracting COVID-19, reduced fever cases tested with RDTs and malaria cases treated related to severe supply chain blocks caused by significant decreases in air cargo capacity, sea freight, and transport logistics. This led to stock outs of antimalarial commodities and delays in the distribution of malaria commodities. In response, the country is intensifying community-led sensitization on ANC attendance to promote ITNs and IPTp; Sensitization of PHU staff to ensure compliance to the malaria treatment guidelines; adapted the WHO-UNICEF global interim guidance on continuity of community based essential health services in the context of COVID-19 and CHWs were oriented on the prevention and control of COVID-19. With regards to integrated community case management (iCCM), CHWs have been following the no-touch policy and treated simple malaria cases presumptively (without RDT test) in the absence of sufficient PPE supplies for CHWs. The CHW hub and partners trained CHWs in malaria case management including COVID-19 precautionary measures. Continuous sensitization of health workers on the precautionary measures of COVID-19 infection is ongoing, as well as constant monitoring of the stock situation including the demand, pipeline management procurement, delivery timelines, supporting in-country stock management and distribution capacity in order to ensure that sufficient quantities (including buffers) are available at any point in time. The IRS campaign has been completed on schedule with high coverage achieved.
helminths. In 2020, preventive chemotherapy coverage was 75% for onchocerciasis, 70% for lymphatic filariasis, 52% for schistosomiasis, and 44% for soil transmitted helminths. Overall, the NTD preventive chemotherapy coverage index for Sierra Leone in 2020 was 59, which represents a decrease compared with the 2019 index value (73).

<td>RMNCAH: Impact</td>
<td>Ensure that essential RMNCAH services are sustained and implemented whilst using Covid-19 sensitive guidelines during the pandemic. Address any stock-outs of essential RMNCAH commodities</td>
<td>Q4 2022</td>
<td></td>
<td>The COVID-19 pandemic has caused a significant disruption in delivery of essential health services. The high burden of infection among health workers directly contributed to some of the disruptions, including temporary closure of health facilities, or selected services within facilities. Essential commodities and supplies were redistributed to prioritize the needs of COVID-19 Treatment Centres, with the result that existing shortfalls in supplies of free healthcare commodities were exacerbated and stock-outs worsened. Training of health workers on continuity of essential services in the context of COVID-19 has been conducted. Mother Support Groups from different districts have been trained on maternal, infant and young child feeding in the context of COVID-19. Health workers in Primary Health care facilities have been supervised and mentored on Integrated Case Management of Newborn and Childhood Illnesses (IMNCI) skills. Special Care Baby Units remained fully functional. 8,700 new national community health workers have been recruited. This has followed the revision of the national CHW Policy. Sierra Leone's CHW programme is a vehicle to deliver a package of RMNCAH+N interventions through home visits for promotional, preventive and basic curative services. The training curriculum includes COVID-19 prevention and control and topics on continuity of essential services during COVID-19. A national integrated IPV, Vitamin A and Albendazole campaign has been conducted in all districts, with 81% coverage for IPV, 75.3% for Vitamin A, and 80% for Albendazole for under five children. Routine vitamin A supplementation is being consolidated including by training and planning involving district medical officers, M&amp;E officers and nutrition officers of all the 16 districts.</td>

Sierra Leone has responded positively to the RMNCAH recommended action addressing low coverage of ARTs in children and continues to track progress as this action is implemented, with increases in coverage recently observed.
